Letter of Achievement

Date: April 08, 2025

To Whom It May Concern,

This letter formally recognizes the outstanding achievement of **Md Hafizur Rahman** in leading the complete server infrastructure migration of the **myLivin (living.my)** platform from Microsoft Azure to a secure, high-performance self-hosted environment. The initiative was successfully executed between January and March 2023 by Hafizur independently, with full ownership over architecture design, systems engineering, and deployment operations.

This migration was initiated as a cost-optimization and performance enhancement initiative and successfully addressed long-standing challenges, including high latency, limited observability, and cloud platform dependency.

Scope of Work

- **Backend (ASP.NET Core Web API & C#):** Migrated a production-grade ASP.NET Core application (written in C#) from Azure App Services to containerized microservices using Docker, ensuring compatibility and configuration parity.
- **Frontend (ASP.NET Core MVC):** Rehosted Razor Pages-based MVC frontend behind a Traefik reverse proxy for efficient routing, TLS termination, and seamless HTTPS enforcement.
- **Database (SQL Server → PostgreSQL):** Converted schemas and migrated transactional data from Azure MSSQL to **PostgreSQL v15** using custom-built zero-loss data transformation scripts, maintaining full referential integrity.
- **Blob Storage:** Replaced Azure Blob Storage with a self-hosted **MinIO** cluster, implementing programmatic blob syncing tools in C# for efficient and secure file transfer.
- **CI/CD:** Designed and deployed a **Docker Compose**-based orchestration strategy for consistent environment setup, automated builds, and service lifecycle management.
- **Observability & Logging:** Integrated **Seq** for centralized, structured logging across multiple services, enabling real-time application insights and root-cause analysis.

- **Networking & Security:** Configured **Traefik** for dynamic reverse proxying with automatic SSL via Let's Encrypt. Applied firewall rules, access policies, and DNS updates to secure system endpoints.

- **Resilience & Rollback:** Maintained rollback capability to Azure resources during the cutover phase, ensuring minimal risk and high availability during production switchover.

Achievements

- Reduced infrastructure costs by **over 50%** compared to Microsoft Azure.

- Eliminated key performance bottlenecks across backend and frontend layers.

- Achieved **near-zero downtime deployments** (average service interruption: 5–8 seconds).

- Enabled advanced observability with structured logs and searchable traces via **Seq**.

- Delivered comprehensive documentation and system backups to ensure long-term maintainability.

Hafizur's independent execution of this mission-critical infrastructure project demonstrates deep expertise in full-stack .NET development, cloud-to-on-premise migration, containerization, infrastructure-as-code, and secure backend engineering. His contributions significantly improved the scalability, reliability, and cost-efficiency of Eboss Technology's core platform.

We confidently recommend Hafizur for any senior-level engineering or DevOps-focused opportunity where system design, security, and technical ownership are paramount.

Sincerely,

Angela Kew Chui Teen

Chief Executive Officer

EBOSS TECHNOLOGY SDN BHD
